

PRIME DIVIDER

System of separation layers

PRIME DIVIDER

The **Prime-Divider** is used to separate layers of metal containers placed on wooden pallets, thus making it possible to obtain two or more pallets starting from a single pallet.

The **Prime-Divider** can be used both by the metal container manufacturer and by the end customer.

ADVANTAGES FOR THE MANUFACTURER OF METALLIC CONTAINERS

If the customer is equipped with the **Prime-Divider**, it will be possible to avoid putting the pallets on top of each other, thus making it possible to supply pallets of the maximum permitted height, reducing production costs and the number of wooden pallets to buy.

In addition, transport costs will be optimized, since with the same space in height it will be possible to transport a higher number of containers.

ADVANTAGES FOR THE CUSTOMER

It allows the customer to purchase pallets of metal containers of the desired height, so as to optimize the spaces in the storage area, reduce purchase costs, and depalletize small productions by hand.

Furthermore with the use of the **Prime-Divider** it will be possible to use depalletizers with a limited height, reducing costs and dimensions, especially in production areas where the height can be a limit.
